

Software

Visocall Mobile
Visocall Mobile is used for query and processing of calls via smartphone. It allows the care staff to communicate with patients and staff anywhere, anytime.

Control panel
The ward control panel ensures a clear and simple display and operation of the Visocall IP system. The graphic interface provides clear ward plans, interactive room buttons, event lists and context-related control buttons. It thus provides a clear overview at any time of the events occurring in the respective ward.

Event database
The event database supports the care documentation. All calls, staff presence and system events are recorded with time, date and corresponding information about the ward and the room name. The database can be searched for events depending on a time period and/or a location, whereby the display and evaluation of the server-side stored data takes place via web browser.

System Monitor
The System Monitor is used for building service departments to evaluate system changes and fault memories or to display system faults. It has password-protected access and can manage several Visocall IP systems.

Audio Manager
The Audio Manager enables targeted announcements, voice prompts or calls to patients and staff. By assigning inputs, audio content can be sent to predefined wards and general announcements can be controlled by external systems.

Patient Management
The Patient Management is used to collect, display and print important patient data, which should be displayed immediately on the screen when a phone call is received. The patient data is required for the entries in the event database, but can also be used optionally, e.g. for the recording and billing of fee data or for the detailed display of alarms from the RTLS.

Installation height

System limits

The configuration of communication systems as well as the installation, commissioning and maintenance of the products (and the systems built with them) require special expertise and may therefore only be carried out by trained specialist personnel.

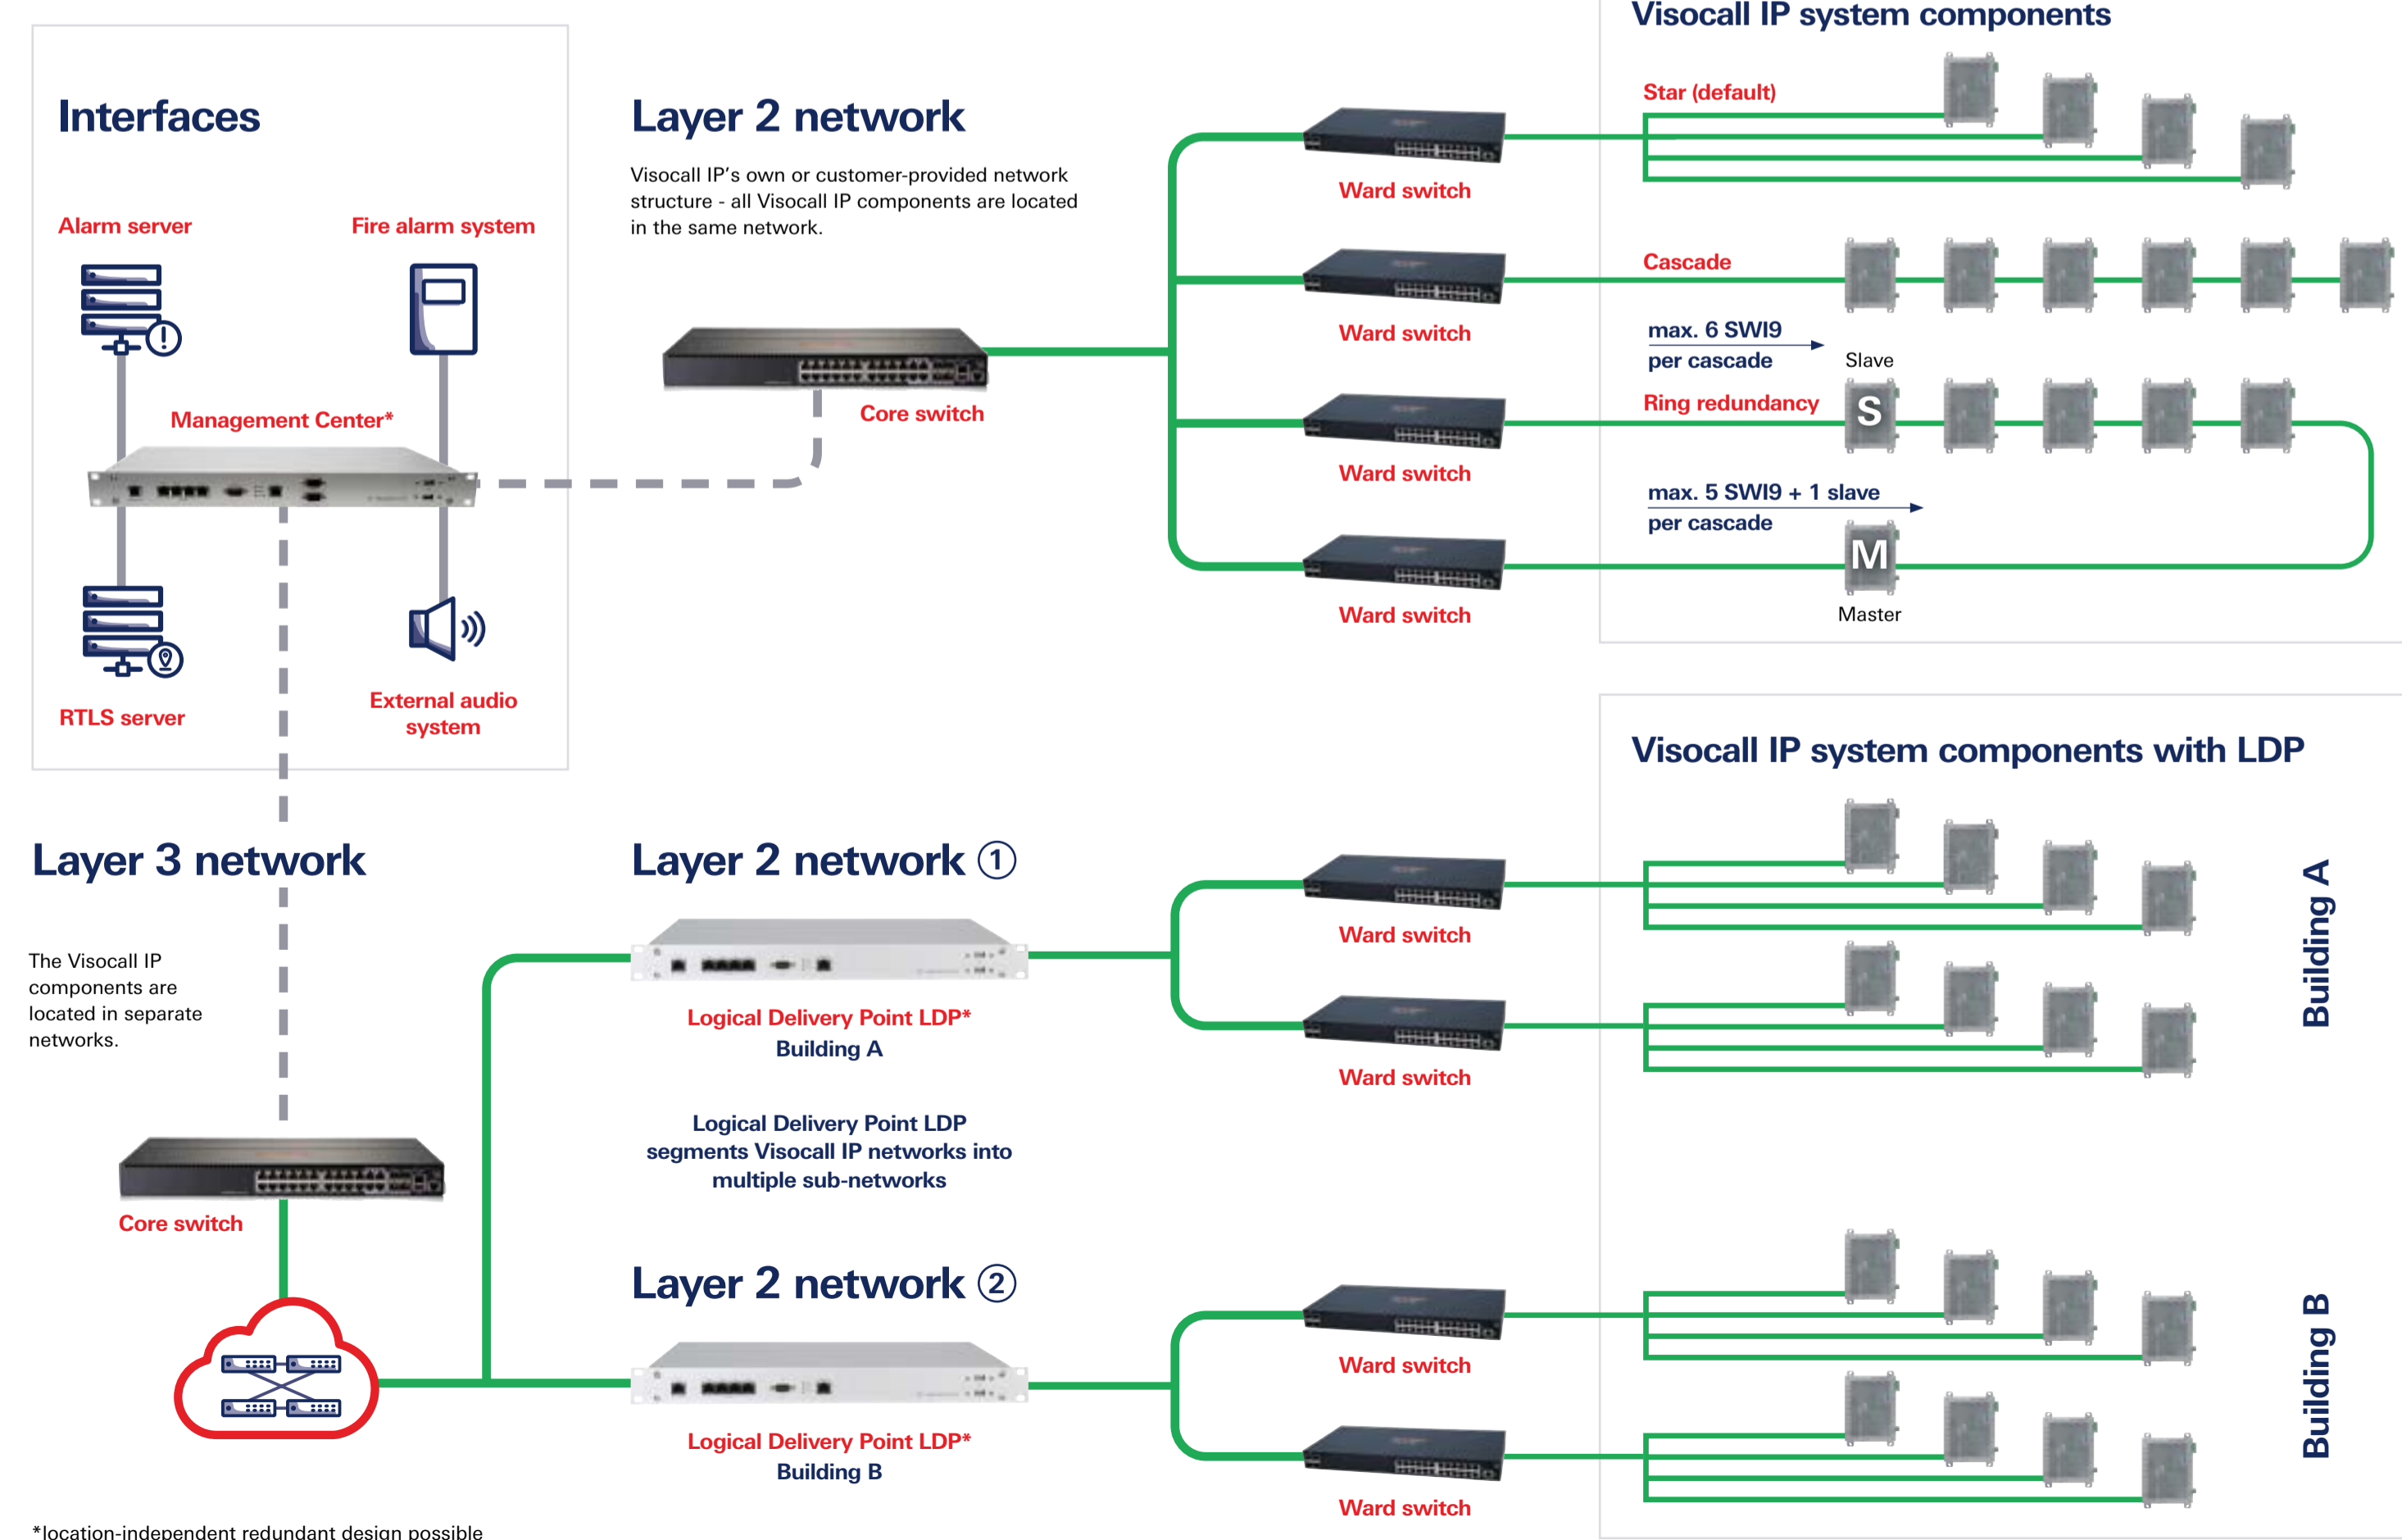

- General:**
- max. 75 wards
 - max. 130 rooms per ward
 - max. 16 beds per room
 - max. 6 system switches per cascade
 - max. 8 sum criteria per system switch
 - max. 2000 IP components per Management Center
 - max. 1000 IP components per Logical Delivery Point

- IP components:**
- max. 100 m cable from uplink
 - max. 100 m cable to communication terminal
 - max. 60 m cable to connection module / Staff Terminal
 - max. 60 m to connection module / patient handset
 - max. 7 patient handsets per system switch

- IO-bus:**
- max. 20 rooms without speech per system switch
 - max. 1200 m cable length
 - max. 127 participants
 - max. 500 mA per IO-bus

- Basic components:**
- max. 50 m cable length to basic components

Networking

*location-independent redundant design possible

Future-proof through IP technology

The increasing demands of a modern hospital require intelligent solutions for planning, implementation and future expansion. Conventional systems no longer meet these requirements in terms of functionality and life cycle costs. System integration with mature IP technology creates new possibilities:

- A powerful network for a wide variety of services and functions avoids a large number of individual installations, cabling expenditure and investment costs.
- System integration offers higher availability and reduced maintenance and operating costs over the entire system life.
- Simple data exchange using the Internet protocol overcomes conventional barriers and enables the smooth interconnection of various trades.

- Staff call
- Telephony
- Voice communication between patient and staff
- Announcements
- Provision of media content (radio, TV, video streaming, Internet, Intranet)
- Control of light, blinds, TV
- Logging care data
- Cost accounting
- Connection of external systems (alarm server, RTLS server, fire alarm system, DECT telephone, external audio system)
- Information from external devices (medical devices, sensor mats etc.)

Cost effective for installation and operation

- Secure, modular and expandable system structure offers planning freedom for all functions and services in the care sector
- Plug-and-play modules reduce commissioning and maintenance costs
- Durable and low-maintenance products

For all forms of organization in health care

- Suitable for centralised, decentralised and mixed organizational forms
- Care organization across ward boundaries
- Call prioritization for fast and targeted response (emergency calls, heart alarm, etc.)
- Large selection of devices for exact adaptation to the care needs
- Intuitively operable devices for staff and patients

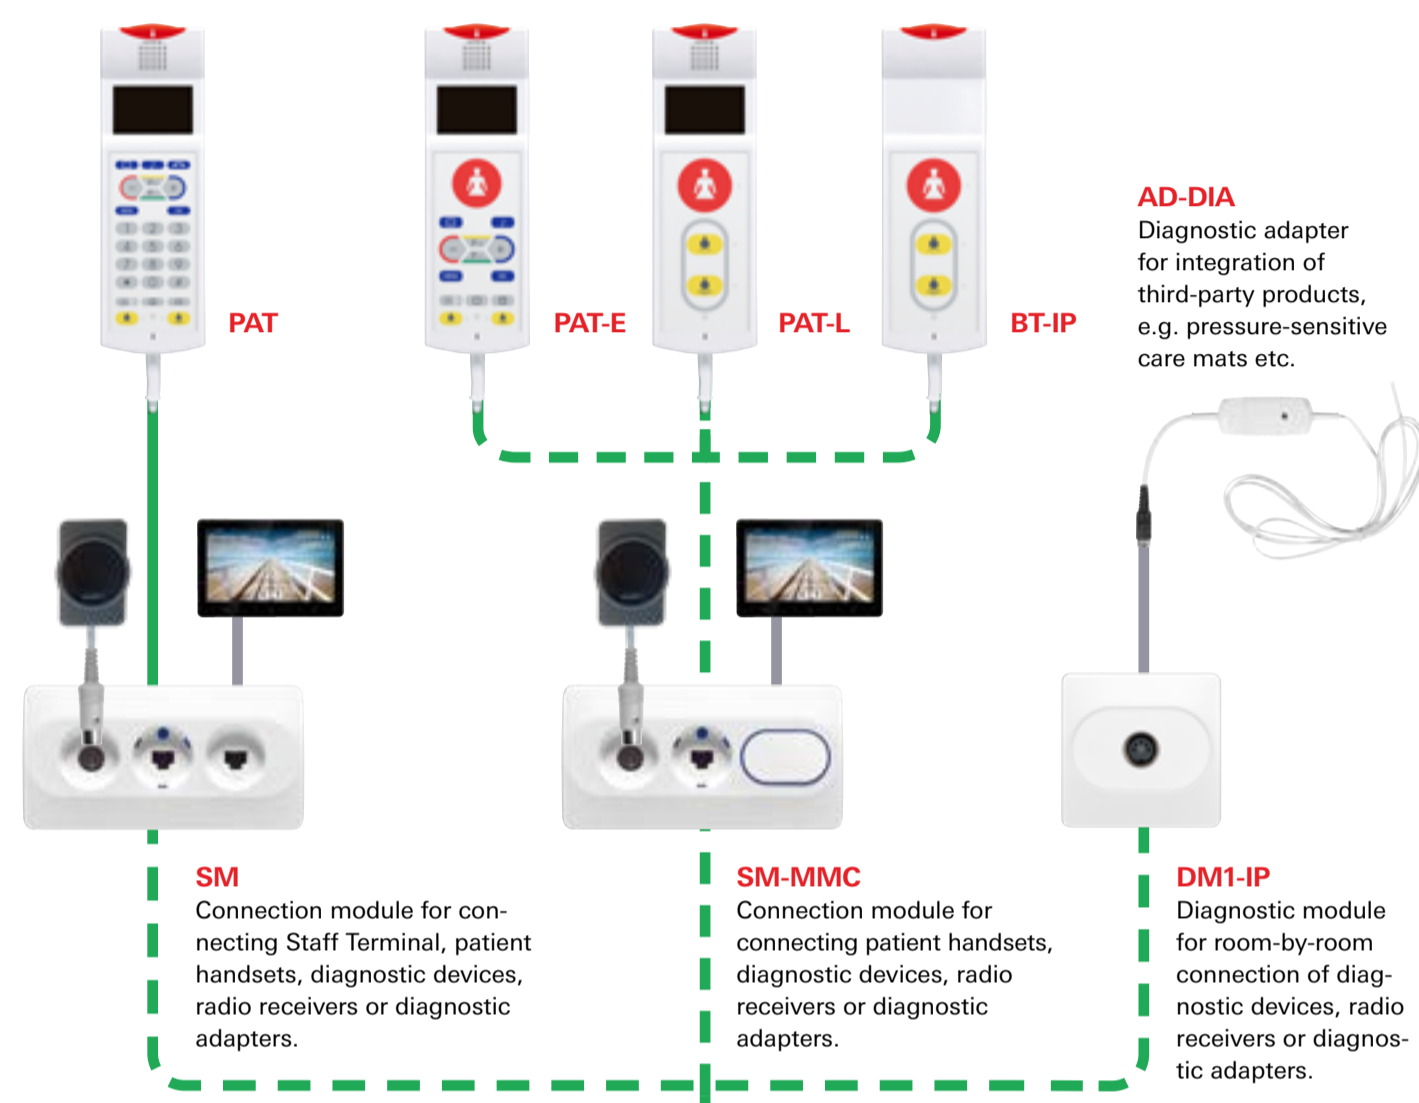

Reliable, compliant with standards and safe

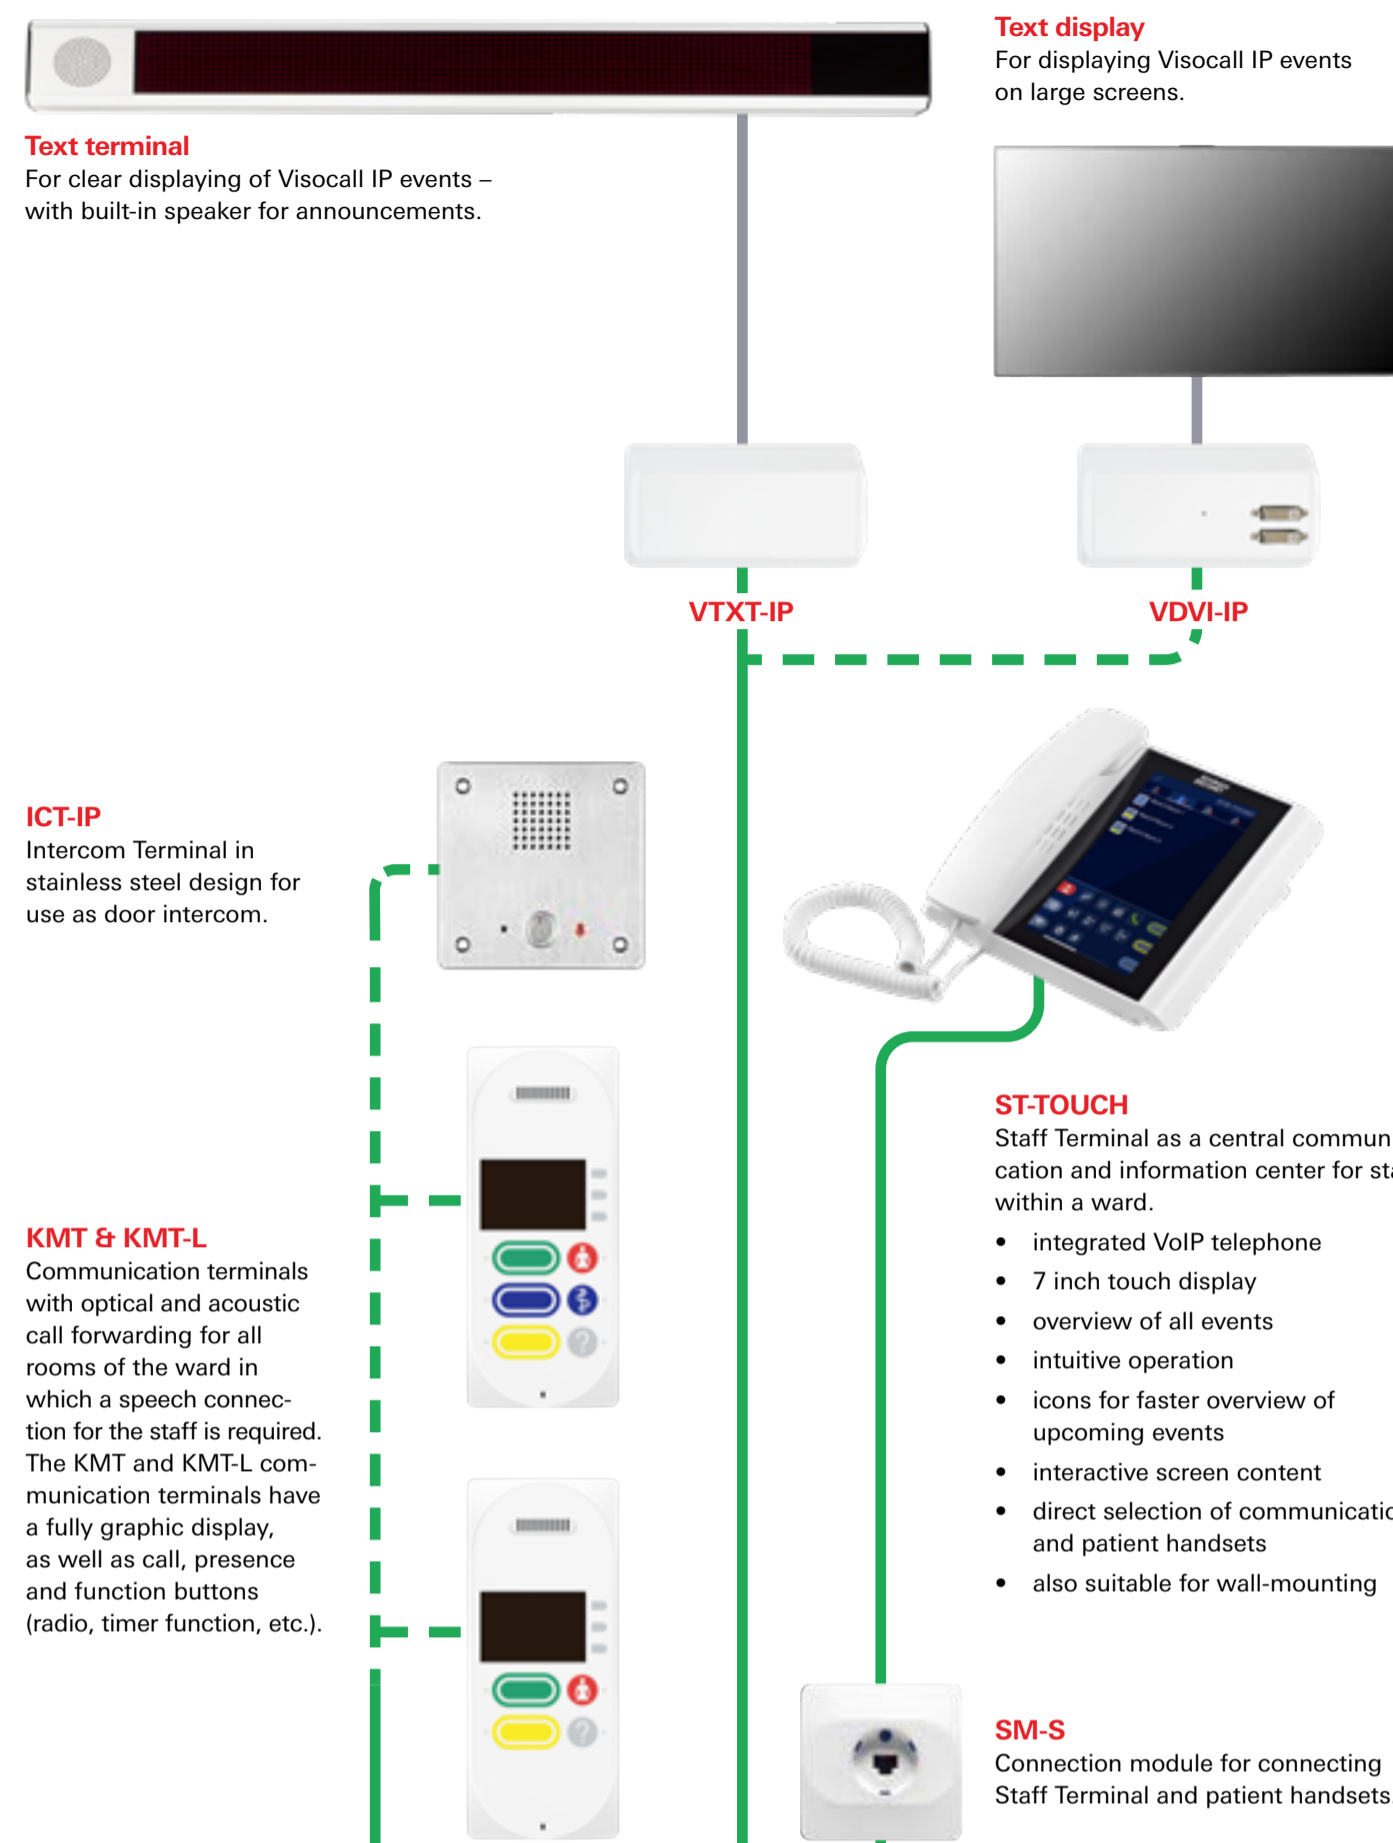

- Highest reliability due to decentralised, intelligent modules
- Redundant structures for uninterrupted system availability
- Clear prioritisation of network services by means of quality of service
- Permanent and automatic function control
- Visocall IP is certified according to VDE 0834 and thus meets the highest requirements regarding safety and reliability

Patient handsets

Operating and indication devices

IO-bus components

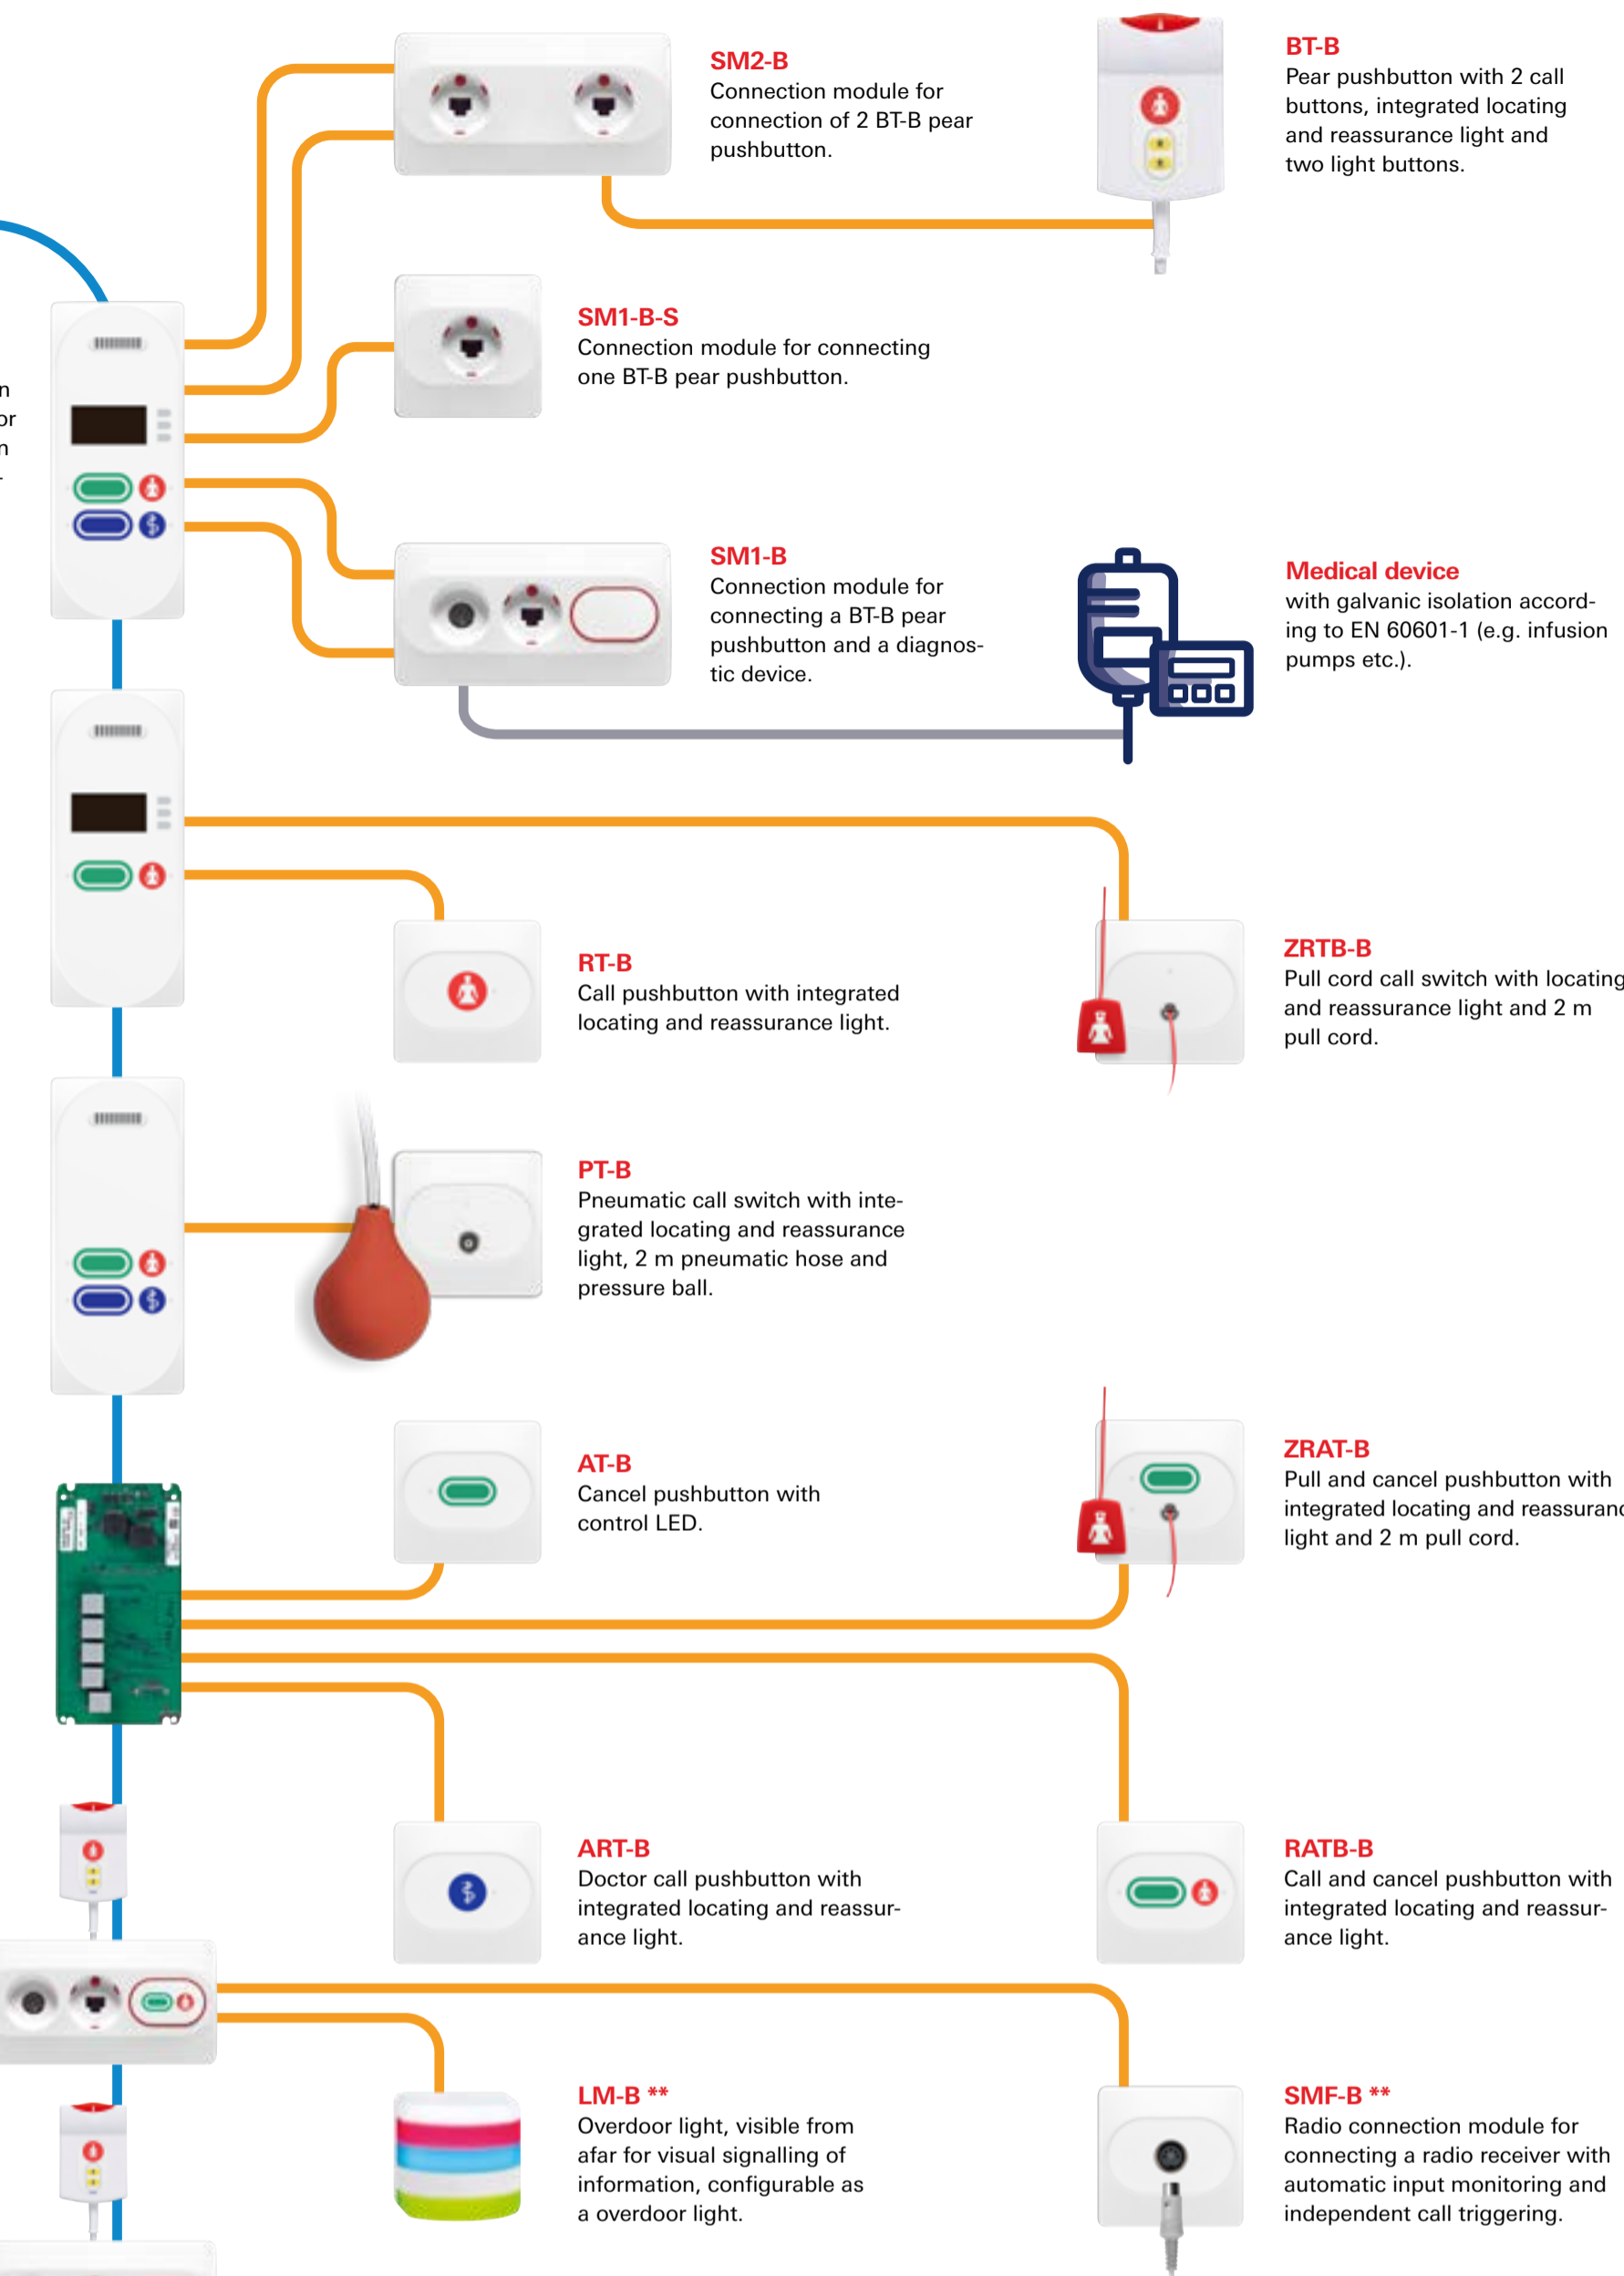

System devices such as call and cancel pushbuttons, overdoor light etc. are connected to the SWI9 system switch and thus to the Visocall IP network via its IO-data bus.

- max. 20 rooms without speech per system switch
- max. 127 participants per IO-bus
- max. 1200 m cable length
- max. 500 mA per IO-bus

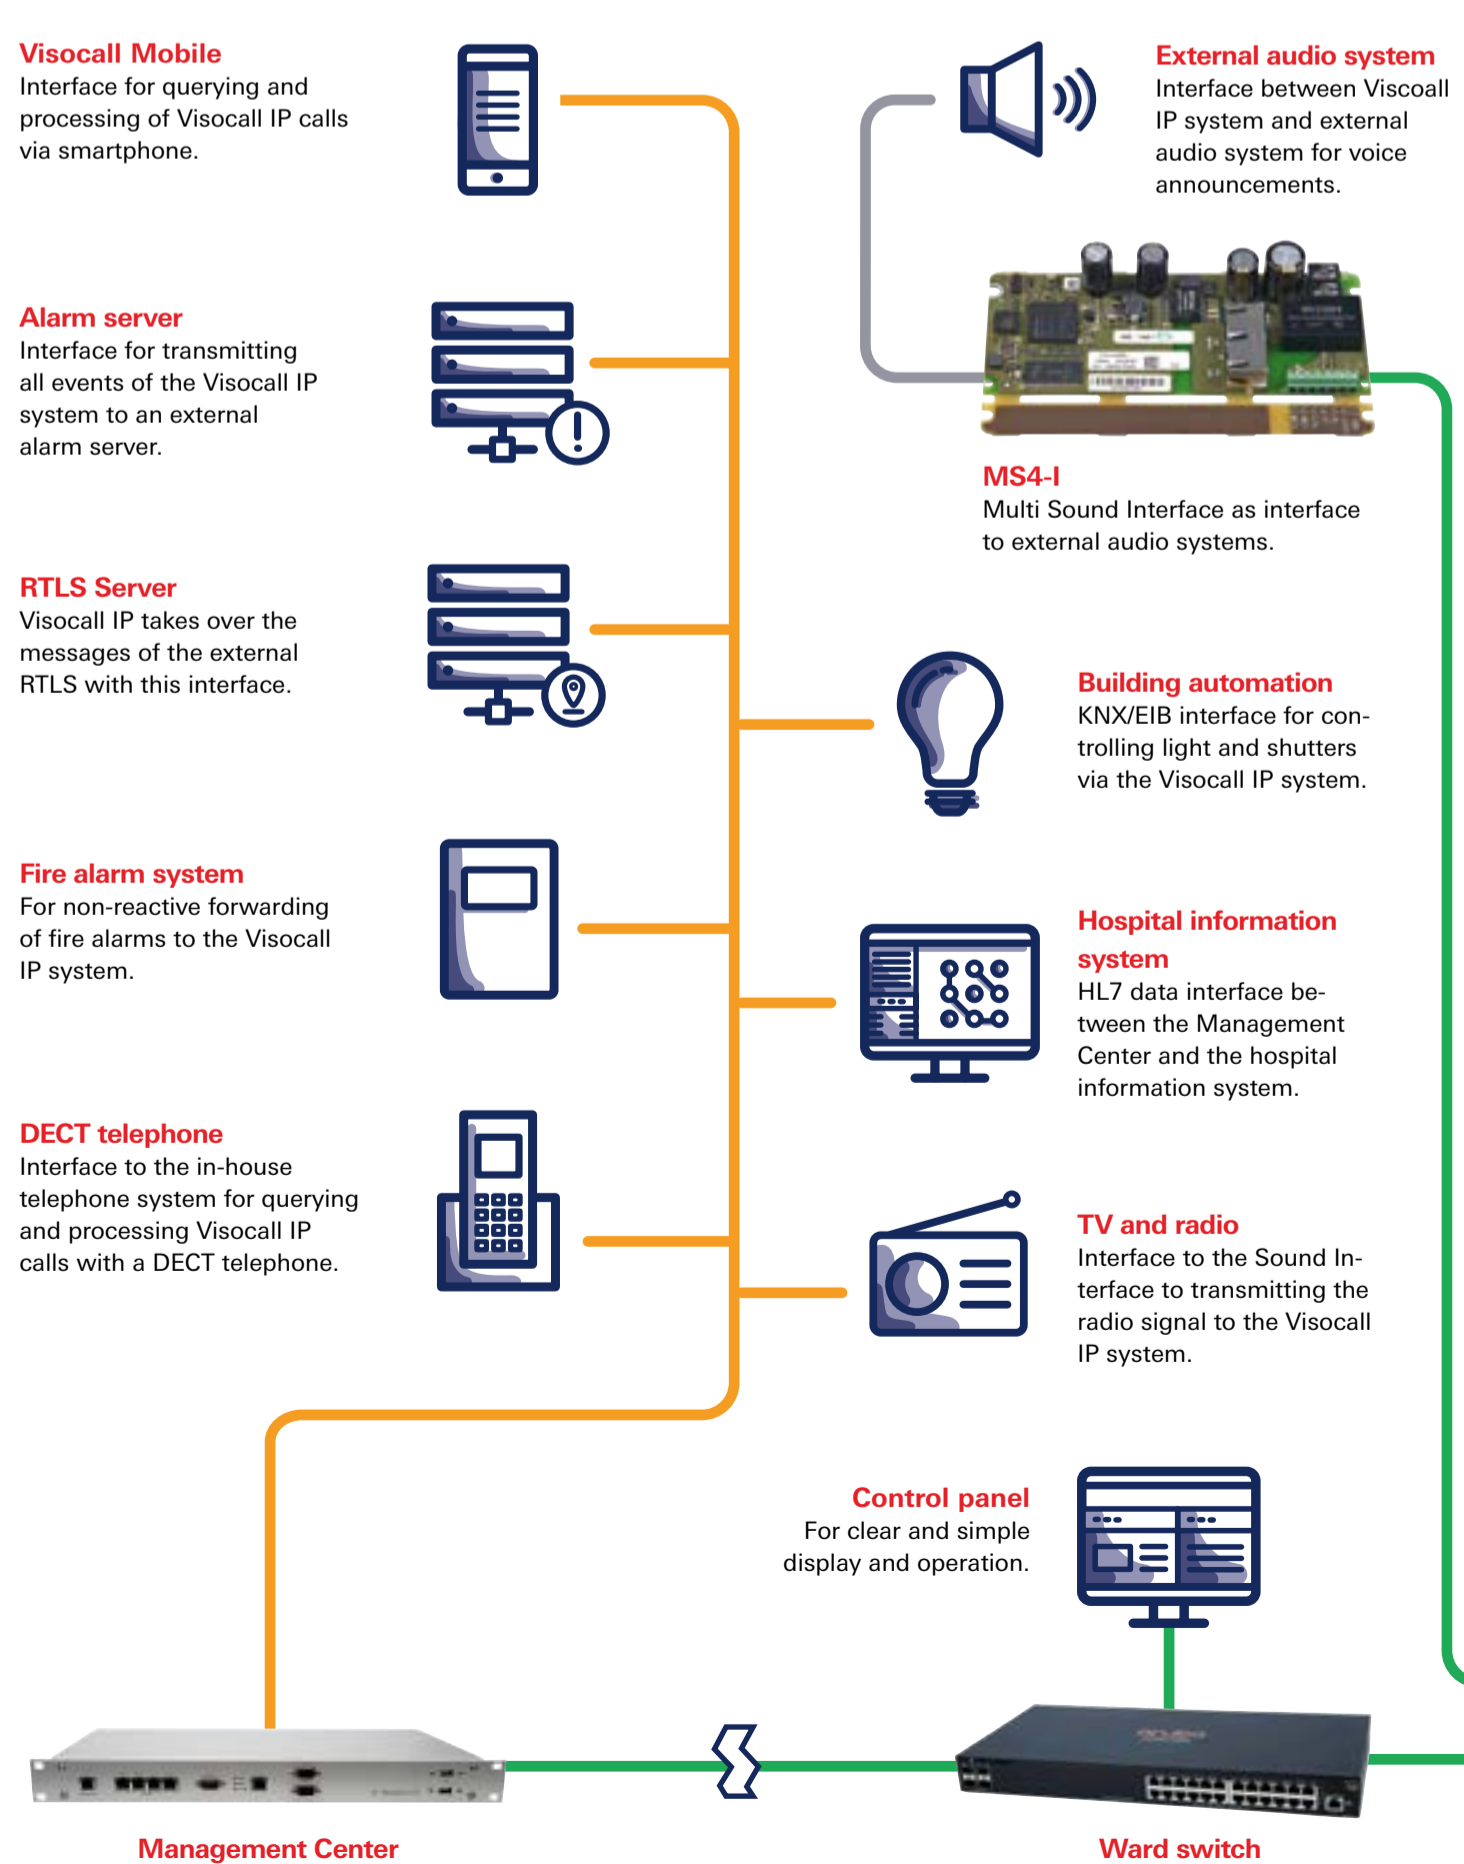

Basic components

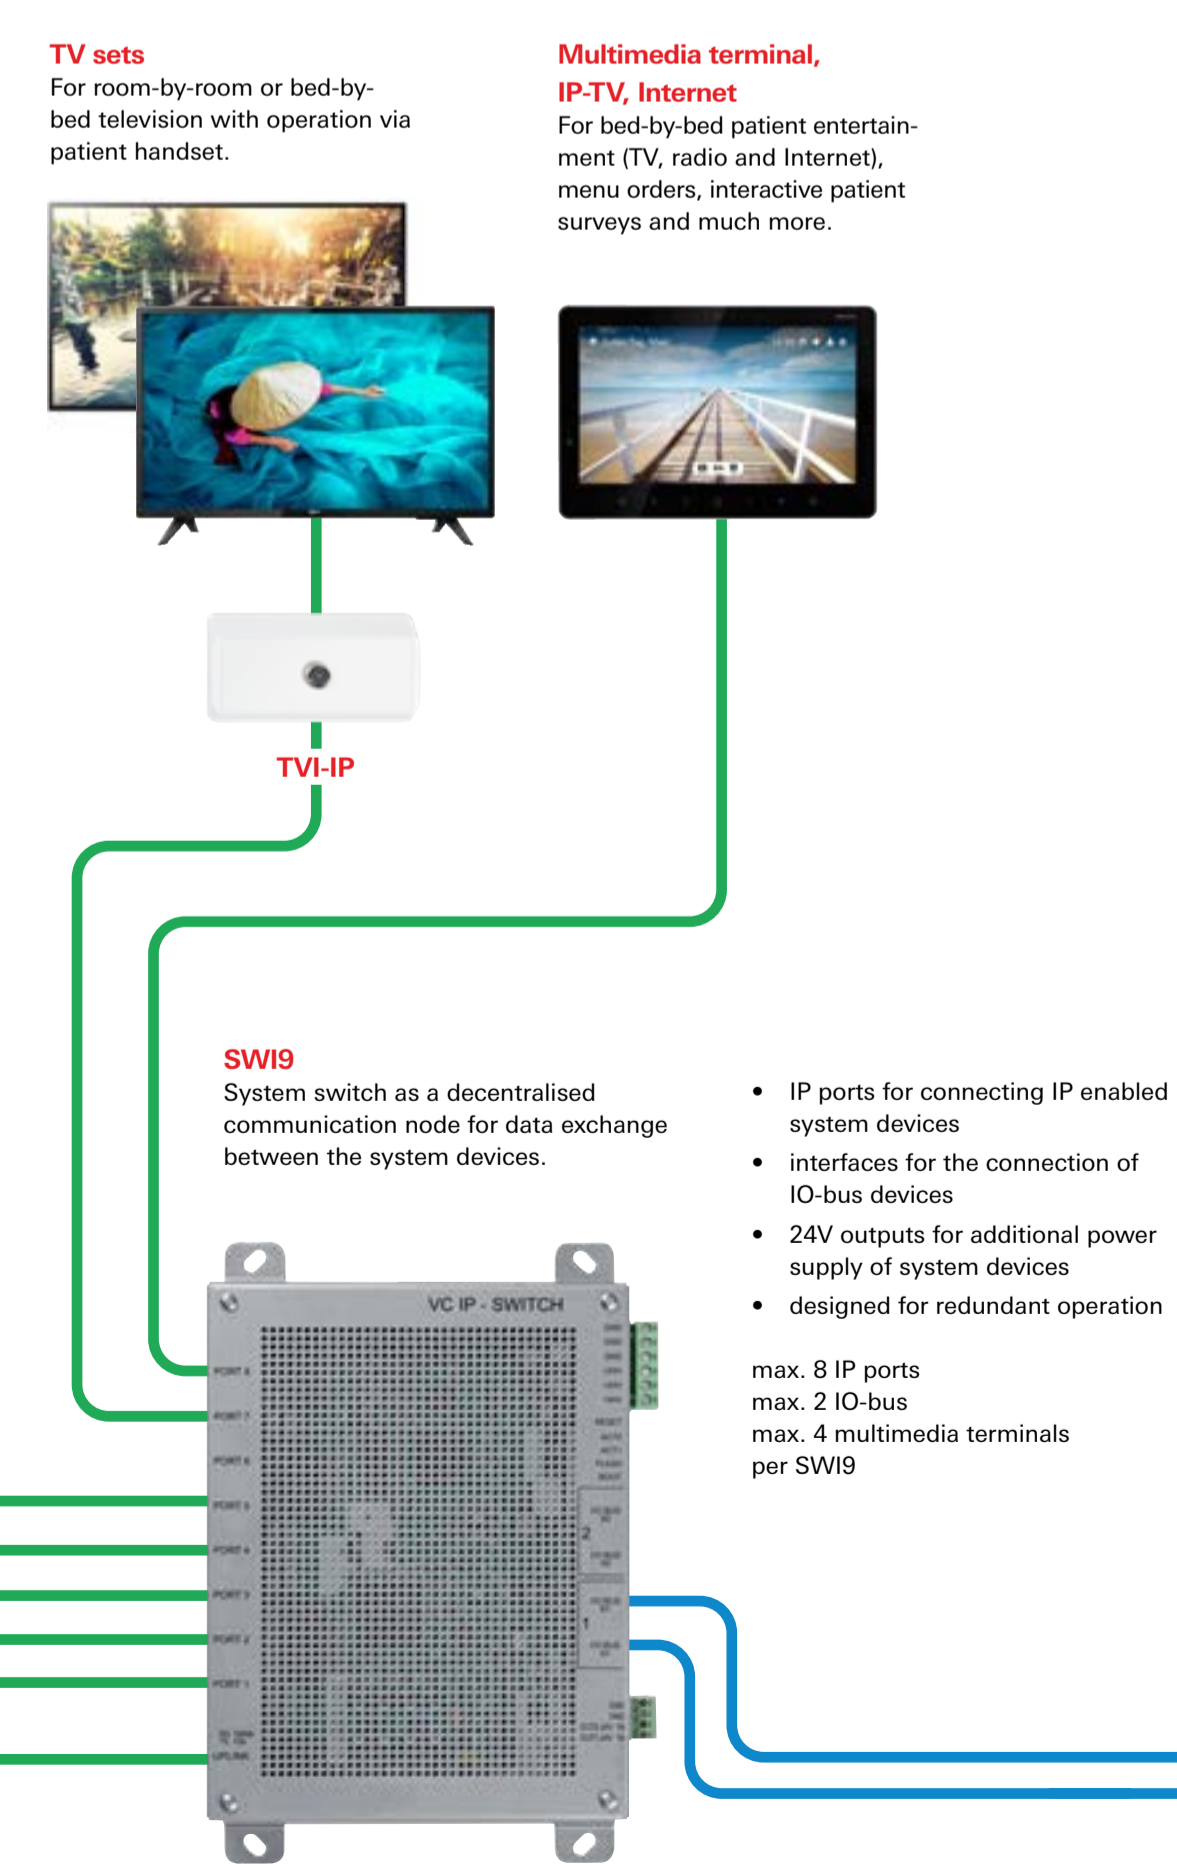

Cable length from IO-bus components to basic components max. 50 m.

Sub-trades and interfaces

TV and Multimedia

** these components require an additional power supply from the SWI9 system switch or from the system power supply unit
